# **The Importance of Nursing**

# Promoting health

01

## Monitoring vital signs

Regularly monitoring the patient's vital signs, such as blood pressure, heart rate, and respiratory rate, can help identify any potential health issues and promote early intervention

02

## Assessing nutritional status

Assessing the patient's nutritional status and providing appropriate dietary advice can help maintain their health and prevent malnutrition or overweight issues

03

## Encoding exercise

Encoding the patient to engage in regular exercise can improve their physical fitness and overall health, prevent chronic diseases, and enhance their quality of life

ACCESS

# Preventing issues

## 要点一

### Vacation

Administering vacancies according to the patient's age and medical conditions can help prevent consecutive diseases and protect the patient from contracting serious illness

## 要点二

### Screening tests

Regularly scheduling screening tests, such as mammograms, colonoscopies, and blood pressure checks, can help detect potential issues at early stages when they are more treatable

## 要点三

### Health education

Teaching the patient about healthy lifestyle choices, such as smoking treatment, balanced diet, and regular exercise, can help prevent chronic diseases and promote overall wellness

# Taking care of patients

## Administrative medicine

Properly administering subscribed medicine to the patient can help manage their symptoms, control their conditions, and prevent further deterioration

## Managing symptoms

Assessing and managing the patient's symptoms, such as pain, shortness of breath, or fatigue, can improve their comfort level and quality of life

## Offering emotional support

Offering emotional support and coming to the patient during their illness or recovery process can help reduce their stress and anxiety levels and promote a positive mental state

# **Types of care**

# Home care

## Definition

Home care refers to nursing services provided at the patient's home, typically by professional nurses or caregivers.

## Service content

including but not limited to daily care, disease management, rehabilitation guidance, etc., aimed at helping patients maintain health and comfort at home.

## Advantages

Convenient and flexible, able to meet the personalized needs of patients while reducing the burden on hospitals.

# Community nursing

## Definition

Community nursing refers to the nursing services provided in the community environment, usually carried out by nurses or caregivers in collaboration with community resources.

## Service content

including preventive healthcare, health education, chronic disease management, etc., aimed at improving the health level of community residents.

## Advantages

It can integrate community resources, promote resident participation, and improve overall health levels.

# Rehabilitation numbering

01

## Definition

Rehabilitation nursing refers to the nursing services provided to patients with physical or psychological disabilities, aimed at helping them recover their function and ability to live independently.

02

## Service content

including physical therapy, occupational therapy, speech therapy, as well as training and guidance on daily life skills.

03

## Advantage

Able to develop personalized rehabilitation plans based on the specific situation of patients, promoting their comprehensive recovery.

# Long term care

## Definition

Long term care refers to the care services provided to patients who require long-term care, usually conducted in nursing homes or nursing homes.

## Service content

including daily care, medical care, psychological support, etc., aimed at meeting the long-term needs of patients.

## Advantages

Being able to provide stable and continuous nursing services for patients, while also having professional medical and nursing team support.
